An unusual button-form australite from Earaheedy Station, Western Australia

W.H. Cleverly
Western Australian School of Mines, P.O Box 597, Kalgoorlie, Western Australia 6430

Australites collected from No.1 Marracoonda Paddock, which is centred 25°52'S, 121°53'E on Earaheedy Station, include an unusual form of button (Figure 1A–D). Flange has developed outward and unevenly instead of coiling backward from the direction of flight into a regular toroidal form. The dimensions of the button are 14.0–16.0 mm diameter x 7.1 mm thick and the weight is 1.51 grams.

The outwardly directed flange (Figure 1B) characterizes buttons of the unusual type studied by Chapman (1964), who reproduced similar shapes from glycerine glass in wind tunnel experiments and enunciated the aerodynamics. Unlike the two buttons studied by Chapman, the Earaheedy button has no obvious flow ridges upon the anterior surface of flight (Figure 1D). However, the edge of the anterior surface has superimposed scallops (Figure 1C), and the low, eyebrow-like ridges bordering the scallops probably constituted a single, almost circumferential flow ridge of peculiarly scalloped shape.

The Earaheedy australite experienced a smaller ratio of body force to aerodynamic force (Chapman 1964) than the other known examples of its type, and has therefore a less exaggerated extension of the flange.

The type buttons and the one from Earaheedy Station are the only three on record but the form might not be as rare as would appear. Additional specimens could have been misidentified and dismissed as “button cores” i.e., buttons of the common type from which weakly attached flange had broken away. The deceptive similarity of the posterior surfaces of flight is illustrated by the Earaheedy button (Figure 1A) and a “button core” in the same collection from No.1 Marracoonda Paddock (Figure 1E). The anterior surface of the button (Figure 1D) shows that the irregular outline is a consequence of the different extents of the melt streams and not a consequence of fracture.

One of the type buttons was found within an area spanning the eastern half of the South Australia/Northern Territory border; the other was found near Gladstone, Tasmania. Those find sites and No.1 Marracoonda Paddock are within the two sectors of occurrence of very heavy australites (Cleverly and Scrymgour 1978), but as there are only three known specimens, this distribution might be fortuitous.

Figure 1 Two australites from Earaheedy Station. Scales are a centimetre divided into millimetres. A–D: Unusual button form. A: Posterior surface of flight showing deceptively broken-looking outline. B: Side view with direction of flight towards bottom of page showing stubby, outwardly directed flange. C: Oblique view of anterior surface showing three of the peripheral scallops with marginal flow ridge. D: Anterior surface of flight showing tendency to petaled shape. E: “Button core”, posterior surface with broken outline resulting from loss of flange.
ACKNOWLEDGEMENT

The late Mr M.K. Quartermaine kindly lent me the australites from his collection and also processed my photographs (Figure 1).

Guide to Authors

Subject Matter:
Reviews, observations and results of research into all branches of natural science and human studies will be considered for publication. However, emphasis is placed on studies pertaining to Western Australia. Longer papers will be considered for publication as a Supplement to the Records of the Western Australian Museum. Short communications should not normally exceed three typed pages and this category of paper is intended to accommodate observations, results or new records of significance, that otherwise might not get into the literature, or for which there is a particular urgency for publication. All material must be original and not have been published elsewhere.

Presentation:
Authors are advised to follow the layout and style in the most recent issue of the Records of the Western Australian Museum including headings, tables, illustrations and references.

The title should be concise, informative and contain key words necessary for retrieval by modern searching techniques. An abridged title (not exceeding 50 letter spaces) should be included for use as a running head.

An abstract must be given in full length papers but not short communications, summarizing the scope of the work and principal findings. It should normally not exceed 2% of the paper and should be suitable for reprinting in reference periodicals.

The International System of units should be used. Numbers should be spelled out from one to nine in descriptive text; figures used for 10 or more. For associated groups, figures should be used consistently, e.g. 5 to 10, not five to 10.

Spelling should follow the Concise Oxford Dictionary.

Systematic papers must conform with the International Codes of Botanical and Zoological Nomenclature and, as far as possible, with their recommendations.

Synonymies should be given in the short form (taxon, author, date, page) and the full reference cited at the end of the paper. All citations, including those associated with scientific names, must be included in the references.

Manuscripts:
The original and two copies of manuscripts and figures should be submitted to the Editors, c/o Publications Department, Western Australian Museum, Francis Street, Perth, Western Australia 6000. They must be in double-spaced typescript on A4 sheets. All margins should be at least 30 mm wide. Tables plus heading and legends to illustrations should be typed on separate pages. The desired position for insertion of tables and illustrations in the text should be indicated in pencil. Tables should be numbered consecutively, have headings which make them understandable without reference to the text, and be referred to in the text.

High quality illustrations are required to size (16.8 cm x 25.2 cm) or no larger than 32 cm x 40 cm with sans serif lettering suitable for reduction to size. Photographs must be good quality black and white prints, not exceeding 16.8 cm x 25.2 cm. Scale must be indicated on illustrations. All maps, line drawings, photographs and graphs, should be numbered in sequence and referred to as Figure/s in the text and captions. Each must have a brief, fully explanatory caption. On acceptance an IBM compatible disk containing all corrections should be sent with amended manuscript. The disk should be marked with program (e.g. WordPerfect, Wordstar, etc).

In papers dealing with historical subjects references may be cited as footnotes. In all other papers references must be cited in the text by author and date and all must be listed alphabetically at the end of the paper. The names of journals are to be given in full.

Processing:
Papers and short communications are reviewed by at least two referees and acceptance or rejection is then decided by the editors.

The senior author is sent one set of page proofs which must be returned promptly.

The senior author will receive fifty free offprints of the paper. Additional offprints can be ordered at page proof stage.
