New *Euryglossa* (*Euhesma*) bees (Hymenoptera: Colletidae: Euryglossinae) associated with the Australian plant genus *Eremophila* (Myoporaceae)

Elizabeth M. Exley
Department of Entomology, University of Queensland, St Lucia, Queensland 4072, Australia

INTRODUCTION

Euryglossine bees are widespread in Australia and most are associated with the plant family Myrtaceae. It is now apparent that large numbers of undescribed species in the subgenus *Euhesma* Michener of the genus *Euryglossa* Smith have been collected on flowering non-Myrtaceous native plants. Many show modification of the head and mouthparts presumably as food plant adaptation. Interest in pollination mechanisms of Australian native plants has grown with the ability to make accurate identifications. Recently collected bees often bear the specific name of the flowers from which they were caught.

Examination of hundreds of *Euhesma* specimens suggest many species may be associated with specific plant species. Houston (1992) described three such species from Western Australia. It is unfortunate that all bees in collections don’t carry full details but many are recorded from *Eremophila* species (Myoporaceae). This Australian plant genus of about 200 species occurs mainly in arid areas of the continent.

Dr Houston has collected widely in the huge state of Western Australia and from almost every site a different *Euhesma* species was taken on *Eremophila*. Whether the plant in each site was always a different species is not known, but *Eremophila* species are mainly shrubs with flowers that can be readily watched and, after this study, with accurate identification of both plant and bees now possible, it is hoped pollination studies will be encouraged.

In this paper, although only closely similar *Euhesma* species recorded from *Eremophila* are dealt with, they are not considered monophyletic. Based on the form of the labial palps 20 species collected from *Eremophila* spp. can be identified and these form three groups. Males have not been collected as often as females and sex association is not always clear so the key presented is for females only.

Houston (1983) mentioned collecting many *Euhesma* with enlarged labial palps from bluish-flowered *Eremophila* species and interspecific variation relates in the main to the development of the labial palps and head length. The head may be lengthened behind the ocelli or the clypeus may be extended well beyond the level of the eyes. There is usually a clear malar space (unknown in most Euryglossinae). The whole labio-maxillary complex may be elongate or various segments of the labial palps enlarged (Figures 1–7). Apart from head shape and labial palps the species described below look very similar and some show only small structural differences concerning texture of frons or clypeus. Whether these indeed indicate species will only be known when more specimens, particularly males, become available.

METHODS

In the descriptions of species, ‘relative head measurements’ express most concisely the size relation between measurements on one head. Most of the specimens were coated with pollen or nectar, or were initially preserved in ethyl alcohol. Characters are obscured and some descriptions are not as complete as others.

Although the first criterion for inclusion in this paper is “collected from *Eremophila*”, 3 specimens recorded here were taken elsewhere: one specimen of *E. (E.) yellowdinensis* from *Melaleuca*; and two specimens of *E. (E.) walker* from *Eucalyptus* sp.

All species names are to be treated as nouns in apposition to *Euhesma*. 
**Abbreviations**

The following collection abbreviations are used:

**Genus Euryglossa** Smith

**Subgenus Euhesma** Michener

**Type species**

_Euryglossa wahlenbergiae_ Michener, 1965: 88 by original designation.

The following description relates to all _Euhesma_ known to be associated with _Eremophila_.

**Description**

Medium sized (length 4-7 mm) _Euhesma_ with head, thorax and propodeum black. Gaster in most dark brown with tergal margins transparent; head longer than wide and narrower than thorax; facial foveae wide, shallow, impressed (Figure 17), upper part broadened and often curved towards ocelli, reaching level of antennal sclerites; eyes converging below; antennae inserted below middle of face with pedicel as long as first two flagellar segments together, all flagellar segments except last wider than long (females), interantennal distance greater than antennocular distance; labial palps as long as or longer than maxillary palps; anterior margin of clypeus broadly truncate; face in profile nearly flat with genal areas anteriorly very narrow (Figure 8); fore tibia with conspicuous apical spine (Figure 9); female with inner hind tibial spur pectinate (Figure 10) and in spite of view shown in Figure 10, outer hind tibial spur strongly curved and shorter, thicker and heavier than inner hind tibial spur; basitibial plate indicated by carina (1 or 2) and tubercles with last tarsal half way or less along hind tibia (Figure 11), both plate and tubercles much stronger in female; tarsal claws with inner tooth (female) (Figure 12), bifid (male); foveae of second gastral tergum large, about as wide as long, diffuse, often difficult to see on dark background; wings evenly and closely covered with macrotrichia; forewing of most with first recurrent vein distal to first transverse cubital; body minutely roughened with face above antennae (Figure 13) and dorsum of thorax consequently dull in most; scattered long white hairs on clypeus, frons, vertex, posterior genae, sides of thorax, legs, sides of propodeum, venter; dense, long, yellowish hairs on gastral tergum 5 of females.

**Key to species of Euhesma collected on Eremophila**

**Females**

1. Labial palps enormously extended, as long as or longer than head ................. 2
2. Labial palps not as long as head .............................................................. (Group 1)...13

2(1). Labial palps with segment 2 much shorter than segment 4 .................... (Group 2)....6
3. Labial palps with segment 2 subequal or longer than segment 4 ........ (Group 3)....3

3(2). Supraclypeal area and clypeus medianly concave; body length about 5 mm .......... ........................................ _E. walkeri_ sp. nov.

4(3). Labial palps with segments 2 and 4 subequal in length .......................... 5
6. Labial palps with segment 2 clearly longer than segment 4 ........... _E.coppinensis_ sp. nov.
5. Labial palps longer than head ................................................................. _E. macrayae_ sp. nov.

5(4). Labial palps as long as head .............................................................. _E. newmanensis_ sp. nov.

6(2). Labial palp segment 3 clearly longer than segment 4 ......................... 7
8. Labial palp segment 3 not clearly longer than segment 4 ..................... 8

7(6). Supraclypeal area, clypeus medianly and frons medianly concave ..................

8. Labial palp segments 3 and 4 together much shorter than head .................. 9
9. Labial palp segments 3 and 4 together about as long as head ................. 10

9(8). Body length about 5 mm ................................................................... _E. yellowdinensis_ sp. nov.

10(8). Tibiae of all legs golden ..................................................................... _E. cuneifolia_ sp. nov.

11. Tibiae of all legs mostly dark brown ......................................................
New Euryglossa (Euhesma) bees

11(10). Fronto-clypeal suture clearly evident ..........  
Average size: Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.7; length 8.0; clypeal length 2.4; lower interocellar distance 4.5; upper interocellar distance 5.0; clypeo-antennal distance 0.5; interantennal distance 1.5; antennocular distance 1.3; ocellar distance 1.4; ocellar distance 1.3. 
Anterior margin of clypeus truncate; lower interocellar distance 4.5; upper interocellar distance 5.0; clypeo-antennal distance 0.5; interantennal distance 1.5; antennocular distance 1.3; ocellar distance 1.4; ocellar distance 1.3. 
Anterior margin of clypeus truncate; upper margin of clypeus slightly concave; malar space evident; labial palp segments in increasing lengths in the order 2, 1, 3, 4. 
Frons and dorsum of thorax with dense reticulation and dull; whole of face below antennal insertions covered with dense reticulation and few punctures, clypeus with median indentation. Labial palp segments 1 and 2 dark brown, 3 and 4 yellowish. 
Forewing with first recurrent vein slightly distal to first transverse cubital. Males are described for 5 species. Species included: E. (E) atra; E. (E) aurata; E. (E) balladonia; E. (E) leonora; E. (E) nallbarra; E. (E) scoparia; E. (E) sturtiensis; E. (E) symmetra. 

Group 2. Eight species with enormously extended labial palps in which segments 1 and 2 are short and dark brown and segments 3 and 4 are long, pale white or yellowish and mostly ribbon-like (Figures 15, 17). In the venation of the forewing, the first recurrent vein is distal to the first transverse cubital. Males are known for 4 species. Species included: E. (E) victrix; E. (E) cuneifolia; E. (E) granitica; E. (E) meeka; E. (E) pantoni; E. (E) sulcata; E. (E) wiluna; E. (E) yellowdinensis. 

Group 3. Four species with enormously extended labial palps in which only segment 1 is short and dark brown, segments 2, 3 and 4 are all extended and paler (Figure 16). In the venation of the forewing, the first recurrent vein is distal to the first transverse cubital. Males are recognised for 2 species in this group. They differ from others in that their heads are as wide as or wider than long (appear square). The area behind the eyes and ocelli is expanded (Figures 18, 19). Species included: E. (E) coppinensis; E. (E) macrayae; E. (E) neumannensis; E. (E) walker. 

In the descriptions that follow species are arranged in alphabetical order in each of these groups.

Group 1

Euryglossa (Euhesma) atra sp. nov. 
Figure 49

Material Examined

Holotype

♀, Boorabbin Rock, Western Australia, 31°12'S, 120°17'E, 4–9 October 1981, T.F. Houston, on flowers of Eremophila (WAM).

Description

Female

Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.7; length 8.0; clypeal length 2.4; lower interocular distance 4.5; upper interocular distance 5.0; clypeo-antennal distance 0.5; interantennal distance 1.5; antennocular distance 1.0; interocellar distance 1.4; ocellar distance 1.3. 
Anterior margin of clypeus truncate, upper margin of clypeus slightly concave; malar space evident; labial palp segments in increasing lengths in the order 2, 1, 3, 4. 
Frons and dorsum of thorax with dense reticulation and dull; whole of face below antennal insertions covered with dense reticulation and few punctures, clypeus with median indentation. Labial palp segments 1 and 2 dark brown, 3 and 4 yellowish. 
Forewing with first recurrent vein slightly distal to first transverse cubital. 

Etymology

The specific name relates to the dull black colour of head and thorax.
Material Examined

Holotype
♀, 35 km E of Norseman, Western Australia, 32°12'S 122°04'E, 30 October 1989, K.L. Walker on Eremophila (MV).

Paratypes

Australia: Western Australia: 1♀, 3♂ same data as holotype (MV).

Description

Female
Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 6.3; length 7.1; clypeal length 1.9; lower interocular distance 3.7; upper interocular distance 4.3; interantennal distance 1.3; antennocular distance 0.7; interocellar distance 1.5; ocellocular distance 1.2. Clypeus with anterior margin indented medianly, upper margin slightly concave, dorsum shining with median longitudinal furrow; labial palps with segments in increasing lengths in the order 2, 1 = 3, 4. Labial palp segment one dark brown, others yellowish; legs dark brown with tibiae and tarsi mostly golden; dorsal surface of gaster golden brown with wide bands across segments 1-3 dark brown; venter light brown.
Forewing with first recurrent vein distal to first transverse cubital.

Male
Length about 4.0 mm; wing length about 3.0 mm. Relative head measurement: width 5.5; length 5.6; clypeal length 1.2; lower interocular distance 2.9; upper interocular distance 4.1; interantennal distance 0.9; antennocular distance 0.7; interocellar distance 1.4; ocellocular distance 1.1; ocelloccipital distance 0.1. Clypeus as in ♀; labial palps with segments in increasing lengths in the order 2, 3, 1, 4.
Labial palp segments 1, 2 dark brown, 3, 4 yellowish; legs dark brown with fore tibiae and all tarsi light brown.
Forewing with first recurrent vein interstitial with first cubital. Long white hairs on head, especially on clypeus.

Remarks
The males described are very much smaller than others in this group. They differ from the females in that colour is black predominantly and the first recurrent vein of the forewing is interstitial with the first cubital.

Etymology
The specific name refers to the golden brown colour on the gaster and legs of the female.

Euryglossa (Euhesma) aurata sp. nov.

Material Examined

Holotype

Paratypes

Australia: Western Australia: 1♀, 3♂ same data as holotype (MV).

Description

Female
Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 6.3; length 7.1; clypeal length 1.9; lower interocular distance 3.7; upper interocular distance 4.3; interantennal distance 1.3; antennocular distance 0.7; interocellar distance 1.5; ocellocular distance 1.2. Clypeus with anterior margin indented medianly, upper margin slightly concave, dorsum shining with median longitudinal furrow; labial palps with segments in increasing lengths in the order 2, 1 = 3, 4. Labial palp segment one dark brown, others yellowish; legs dark brown with tibiae and tarsi mostly golden; dorsal surface of gaster golden brown with wide bands across segments 1-3 dark brown; venter light brown.
Forewing with first recurrent vein distal to first transverse cubital.

Male
Length about 4.0 mm; wing length about 3.0 mm. Relative head measurements: width 5.5; length 5.6; clypeal length 1.2; lower interocular distance 2.9; upper interocular distance 4.1; interantennal distance 0.9; antennocular distance 0.7; interocellar distance 1.4; ocellocular distance 1.1; ocelloccipital distance 0.1. Clypeus as in ♀; labial palps with segments in increasing lengths in the order 2, 3, 1, 4.
Labial palp segments 1, 2 dark brown, 3, 4 yellowish; legs dark brown with fore tibiae and all tarsi light brown.
Forewing with first recurrent vein interstitial with first cubital. Long white hairs on head, especially on clypeus.

Remarks
The males described are very much smaller than others in this group. They differ from the females in that colour is black predominantly and the first recurrent vein of the forewing is interstitial with the first cubital.

Euryglossa (Euhesma) balladonia sp. nov.

Material Examined

Holotype
♀, 32°12'S 123°18'E, 35 km NW by W Balladonia RH, Western Australia, 18 September 1981, I.D. Naumann and I.C. Cardale, on flowers of Eremophila (ANIC).

Paratypes

Australia: Western Australia: 1♀, 1♂ same data as holotype (ANIC).

Other Material

Australia: Western Australia: 7♀, 2♂, 32°27'S 121°41'E, 30 km SSW of Norseman, 19 September 1981, I.D. Naumann and J.C. Cardale, (ANIC).

Description

Female
Length about 5.5 mm; wing length about 4.0 mm. Relative head measurements: width 7.4; length 7.7; clypeal length 2.3; lower interocular distance 4.3; upper interocular distance 5.0; interantennal distance 1.7; antennocular distance 1.1; interocellar distance 1.6; ocellocular distance 1.0; ocelloccipital distance 0.1. Upper margin of clypeus straight; labial palps with segments in increasing lengths 2, 1, 3, 4; fronto-clypeal suture distinct; clypeus not smooth, but with a low sheen.
Labial palp segments 1 and 2, dark brown, 3 and 4 golden brown (all dark brown in specimens from Norseman).
Forewing with first recurrent vein interstitial with first transverse cubital.

Male
Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.0; length 7.0; clypeal length 2.0; lower interocular distance 3.8; upper interocular distance 4.5; interantennal distance 1.2; antennocular distance 0.8; interocellar distance 1.6; ocellocular distance 0.9. Antennae long, middle flagellar segments longer than wide; basitibial plate indicated by carina and tubercles with terminal tubercle about 1/3 along hind tibia.
Forewing with first recurrent vein interstitial with first transverse cubital.

Seventh gastral sternum (Figure 37) with branched hairs on all 4 lobes. Eighth gastral sternum (Figure 46) with branched hairs laterally on distal shaft.
New Euryglossa (Euhesma) bees

Figures 1-7  Labial palps of female Euryglossa (Euhesma) species collected on flowers of Eremophila species. 1, E. leonora; 2, E. scoparia; 3, E. nalbarra; 4, E. symmetra; 5, E. meeka; 6, E. sulcata; 7, E. macrayae. Scale line = 0.5mm.

Remarks
This is the only species in which the antennae of males are longer than usual with the middle flagellar segments longer than wide.

Etymology
The specific name refers to the type locality.

Euryglossa (Euhesma) leonora sp. nov.
Figures 1, 22, 23, 33, 42, 49

Material Examined
Holotype
♀, 50 km E of Leonora, Western Australia, 28°51'S 121°50'E, 10 September 1982, B. Hanich and T.F. Houston, on flowers of Eremophila pantonii (WAM).

Paratypes
Australia: Western Australia: 1 ♀, same data as holotype (WAM).

Other Material
Australia: Western Australia: 1 ♀, 9♂, 4 miles (6.4 km) NE of Menzies, 2 September 1971, T.F. Houston, on blue Eremophila (WAM).

Description
Female
Length about 5.5 mm; wing length about 4.0 mm. Relative head measurements: width 7.4; length 8.0; lower interocular distance 4.3; upper interocular distance 4.9; interantennal distance 1.4; antennocular distance 0.9; interocellar distance 1.9; ocellocipital distance 0.1. Anterior margin of clypeus broadly truncate; labial palps slightly longer than maxillary palps with segments in increasing lengths in the order 2, 1, 3, 4 (Figure 1); malar space short; horizontal zone of propodeum longer than metanotum; clypeus shining with punctures wide apart; frons above antennae dull.

Head black with antennal flagella yellowish ventrally; labial palps with segments 1, 2 dark brown, segments 3 and 4 light brown with basal parts dark brown; legs dark brown with fore tibiae anteriorly and all tarsi yellowish.

Forewing with first recurrent vein interstitial with first transverse cubital.

Scattered long white hairs on frons, clypeus, vertex, mandibles, posterior genae, sides of thorax, legs, venter, gastral tergum 5.

Male
Length about 4.5 mm; wing length about 3.7 mm. Relative head measurements: width 5.1; length 5.1; clypeal length 1.5; lower interocular distance 2.6; upper interocular distance 3.5; clypeo-antennal distance 0.3; interantennal distance 0.9; antennocular distance 0.6; intercellar distance 1.3; ocellocular distance 0.9; ocellocipital distance 0.1. Labial palps and forewings as in female; inner hind tibial spur finely pectinate; horizontal zone of propodeum sloping, longer than metanotum; frons above antennae dullish with close reticulation and close punctures.
Terminalia (Figures 22, 23, 33, 42). The seventh gastral sternum (Figure 33) seems quite unlike any others examined.

**Etymology**
The specific name refers to the type locality.

_Euryglossa (Euhesma) nalbarra_ sp. novo
Figures 3, 10, 14, 20, 21, 31, 32, 40, 41, 49

**Material Examined**

*Holotype*
♀, 7 km W. Nalbarra HS, Western Australia, 28°39'S 117°36'E, 29–30 August 1981, T.F. Houston, on flowers of _Eremophila affin. georgei_ (WAM).

*Paratypes*

Australia: Western Australia: 10♀, 2♂, same data as holotype (WAM); 1♀, 4♂, 26 miles (41.6 km) SSE of Wiluna, 1 November 1971, T.F. Houston, on blue _Eremophila_ (WAM); 1♀, 9 km ENE of Anketell HS, 28°02'S 118°51'E, 3–6 September 1981, T.F. Houston, on flowers of _Eremophila cf. spinosa_ (WAM).

**Description**

*Female*

Length about 7.0 mm; wing length about 5.0 mm.
Relative head measurements: width 8.6; length 10.1; clypeal length 3.9; lower interocular distance 5.5; upper interocular distance 5.8; interantennal distance 1.8; antennocular distance 0.9; interocellar distance 2.1; ocellocellular distance 0.8. Anterior margin of clypeus indented medially, upper margin of clypeus concave; malar space distinct, labial palps longer than maxillary palps with segments in increasing lengths 1 = 2, 3, 4, all segments subcylindrical (Figures 3, 14); horizontal zone of propodeum sloping, longer than metanotum; clypeus shining with punctures wide apart; foveae of 2nd segment of gaster about twice as long as wide.

Head black, antennae with scapes and pedicels black, flagella black dorsally, yellowish ventrally; labial palps with segments 1 and 2 dark brown, segments 3 and 4 brown; legs dark brown with all tarsi yellowish.

Forewing with first recurrent vein interstitial with first transverse cubital. Scattered long white hairs on frons, vertex, clypeus, antennal scapes, mandibles, posterior genae, sides of thorax and propodeum, legs, venter; long, golden hairs on gastral tergum 5.

*Male*

Length about 5.5 mm; wing length about 4.0 mm.
Relative head measurements: width 7.6; length 8.4; clypeal length 2.6; lower interocular distance 4.4; upper interocular distance 5.2; interantennal distance 1.3; antennocular distance 0.9; interocellar distance 2.0; ocellocellular distance 1.1; ocellocipital distance 0.4. Anterior margin of clypeus broadly truncate, upper margin of clypeus slightly concave; labial palps as in female; inner hind tibial spur ciliate; horizontal zone of propodeum longer than metanotum; frons above antennae dullish, covered with very close reticulation, punctures not obvious. Colour as in female with fore femora yellowish anteriorly. Forewing as in female. Scattered long white hairs on frons, vertex, clypeus, antennal scapes, mandibles, posterior genae, sides of thorax and propodeum, legs.

Terminalia (Figures 20, 21, 31, 32, 40, 41). The seventh gastral sternum (Figures 31, 32) has long branched hairs on only two lobes.

**Etymology**

The species is named from the type locality.

_Euryglossa (Euhesma) scoparia_ sp. novo

**Description**

**Female**
Length about 5.0 mm; wing length about 4.0 mm. Relative head measurements: width 6.3; length 7.7; clypeal length 2.2; lower interocular distance 3.6; upper interocular distance 4.2; interantennal distance 1.2; antennocular distance 0.8; interocellar distance 1.4; ocellocular distance 1.2; ocellocippital distance 0.3. Labial palps longer than maxillary palps with segments in increasing lengths in the order 2, 1, 3, 4; malar space distinct, clypeus and supraclypeal area shining, frons above antennae dull, with close reticulation and wide apart punctures. Labial palp segments 1 and 2 dark brown, 3 and 4 yellowish; legs dark brown with tibiae and tarsi mainly yellowish. Dorsal surface of gaster variable — in most golden with wide transverse bands of dark brown across segments 1–4.

Forewing with first recurrent vein distal to first transverse cubital.

**Male**
Length about 4.0 mm; wing length about 3.0 mm. Relative head measurements: width 5.5; length 7.0; clypeal length 2.0; lower interocular distance 3.0; upper interocular distance 3.9; interantennal distance 0.9; antennocular distance 0.6; interocellar distance 1.4; ocellocular distance 1.0; ocellocippital distance 0.2. Labial palps as in female. Colour more yellow (light brown) than female on anterior margin of clypeus, labrum, legs and venter; last gastral tergum polished, yellow. Forewing as in female. Terminalia as in Figures 39 and 45. Eighth gastral tergum with distal shaft short and stout with hairs lateral only.

**Remarks**
The Queensland specimens (only females known) tend to be larger and more variable in colour than those from the Northern Territory. They may represent another species.

**Etymology**
The specific name refers to the plant from which some of the specimens were collected.

**Euryglossa (Euhesma) symmetra** sp. novo
Figures 4, 49

**Material Examined**

**Holotype**
♀, 13 miles (20.8 km) E of Meekatharra, Western Australia, 31 August 1971, T.F. Houston, on blue *Eremophila* (WAM).

**Paratype**

**Australia: Western Australia:** 1 ♀, same data as holotype (WAM).

**Description**

**Female**
Length about 6.8 mm; wing length about 4.0 mm. Relative head measurements: width 7.8;
length 9.2; lower interocular distance 4.7; upper interocular distance 5.5; interantennal distance 1.6; antennocular distance 1.1; interocellar distance 1.9; ocellocular distance 1.6; ocelloccipital distance 0.4. Clypeus extended well below lower ends of eyes; anterior margin of clypeus indented medianly; labial palps (Figure 4) longer than maxillary palps, segments of increasing length in the order 2, 1, 3, 4, segment 3 broadest; malar space distinct; horizontal zone of propodeum about as long as metanotum; clypeus and supraclypeal area highly polished.

Labial palps with segments 1 and 2 dark brown, segments 3 and 4 golden; legs dark brown with tarsi yellow-brown.

Forewing with first recurrent vein slightly distal to first recurrent cubital.

Scattered long white hairs on face, scapes, genae posteriorly, vertex, dorsum of thorax, sides of propodeum; longer scattered white hairs on sides of thorax, legs, posterior half of gastral sterna, long brown hairs on last two gastral terga.

Etymology

The specific name meaning 'similar' refers to the similarity of this species with *nalbarra*.

**Group 2**

*Euryglossa (Euhesma) alicia* sp. nov.

**Material Examined**

**Holotype**

♀, 53 km E by N of Alice Springs, Northern Territory, 23°35'S 134°22'E, 6 October 1978, J.C. Cardale, on *Eremophila* sp. (ANIC).

**Description**

**Female**

Length about 7.0 mm; wing length about 5.0 mm. Relative head measurements: width 8.7; length 10.0; lower interocular distance 5.2; upper interocular distance 5.7; interantennal distance 1.9; antennocular distance 1.1; interocellar distance 1.0; intercellar distance 1.5. Labial palps longer than head, segments in increasing lengths 1 = 2, 3, 4 with segments 3 and 4 ribbon-like. Labial palps with segments 1 and 2 dark brown, segments 3 and 4 yellowish; legs dark brown with tibiae and tarsi golden; dorsal surface of gaster with transparent tergal margins giving almost a banded appearance.

Scattered long white hairs particularly on ventral body surface and legs; dense long golden hairs on gastral tergum 5.

**Etymology**

The specific name refers to the area near which the holotype was taken.

*Euryglossa (Euhesma) cuneifolia* sp. nov.

**Material Examined**

**Holotype**

♀, 16 km WSW of Lyons River Homestead, Western Australia, 24°38'S 115°20'E, 30 August – 1 September 1980, C.A. Howard and T.F. Houston, on *Eremophila cuneifolia* [sic.] Kraenzlin (WAM).

**Paratype**

**Australia: Western Australia:** 1 ♀, same data as holotype (WAM).

**Other Material**

**Australia: Western Australia:** 1 ♀, 14 miles (22.4 km) NE of Newman, 28 August 1971, on *Eremophila* (WAM).

**Description**

**Female**

Length about 7.0 mm; wing length about 5.0 mm. Relative head measurements: width 8.5; length 10.0; lower interocular distance 5.3; upper interocular distance 6.0; interantennal distance 1.9; antennocular distance 2.0; ocellocular distance 1.5. Anterior margin of clypeus slightly indented; fronto-clypeal suture faint; facial foveae wide, shallow; malar space short; frontal line distinct; frons above antennae dull with fine reticulation and sparse punctures; clypeus and supraclypeal area shining; foveae of second tergum of gaster difficult to see, about as wide as long; labial palp segments in increasing lengths 1 = 2, 3, 4, with segments 3 and 4 ribbon-like.

Labial palps with segments 1 and 2 dark brown, segments 3 and 4 yellowish; legs dark brown with tibiae and tarsi golden; dorsal surface of gaster with transparent tergal margins giving almost a banded appearance.

Scattered long white hairs particularly on ventral body surface and legs; dense long golden hairs on gastral tergum 5.

**Etymology**

The specific name refers to the species of *Eremophila* from which the types were collected.

*Euryglossa (Euhesma) granitica* sp. nov.

**Material Examined**

**Holotype**

♀, 22 km S of Mt Magnet, Western Australia, 28°04'S 117°51'E, 6 September 1980, C.A. Howard and T.F. Houston, on flowers of *Eremophila granitica* S. Moore (WAM).
Figures 20-30  Male genitalia of *Euryglossa (Euhesma)* species. (20-29 dorsal and ventral views): 20, 21, *E. nabalba*; 22, 23, *E. leonora*; 24, 25, *E. meeka*; 26, 27, *E. sulcata*; 28, 29, *E. macrayae*; 30, cup-like tip of gonocoxite of *E. coppinensis*. Scale lines = 0.5mm. Line on left refers to Figure 30 only.
**Description**

**Female**
Length about 6.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.3; length 9.1; clypeal length 2.7; lower interocular distance 4.7; upper interocular distance 4.8; interantennal distance 1.3; antennocular distance 0.8; interocellar distance 1.5; clypeo-antennal distance 0.7; ocellocipital distance 0.5. Anterior margin of clypeus truncate, clypeus in side view somewhat convex; frontal line distinct; labial palps as long as head with segments in increasing lengths in the order 2, 1, 3 = 4; basitibial plate with terminal tubercle about 1/3 length of hind tibia; horizontal zone of propodeum longer than metanotum; frons and clypeus shining with punctures quite far apart; almost no sign of fronto-clypeal suture.

Colour dark brown with antennal flagellum anteriorly, labial segments 3 and 4, tibial bases and all tarsi yellowish.

**Male**
Length about 6.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.7; length 8.7; clypeal length 2.4; lower interocular distance 4.8; upper interocular distance 5.2; clypeo-antennal distance 0.7; interantennal distance 1.2; antennocular distance 1.1; interocellar distance 1.7; ocellocipital distance 0.6. Anterior margin of clypeus truncate; frontal line distinct; labial palps as in female, basitibial plate surrounded by a carina, about 1/5 length of hind tibia. Dark brown with antennal flagellum anteriorly, labial segments 3 and 4, tibial bases and all tarsi yellowish. Clypeus dorsally with many long white hairs.

**Remarks**
This species is very similar to *E. meeka*.

**Etymology**
Its name refers to the species of *Eremophila* from which it was collected.

---

**Euryglossa (Euhesma) meeka** sp. nov.
Figures 5, 24, 25, 34, 43, 50

**Material Examined**

**Holotype**
♀, 13 miles (20.8 km) E of Meekatharra, Western Australia, 31 August 1971, T.F. Houston, on blue *Eremophila* (WAM).

---

**Paratypes**

**Australia: Western Australia**: 1 ♀, 2 ♂, same data as holotype (WAM, UQIC).

**Description**

**Female**
Length about 6.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.7; length 9.2; clypeal length 2.7; lower interocular distance 4.7; upper interocular distance 4.8; interantennal distance 1.3; antennocular distance 0.8; interocellar distance 1.5; clypeo-antennal distance 1.1; interocellar distance 1.8; clypeo-antennal distance 0.5. Anterior margin of clypeus truncate, clypeus in side view somewhat convex; frontal line distinct; labial palps of segments in increasing lengths in the order 2, 1, 3 = 4; basitibial plate with terminal tubercle about 1/3 length of hind tibia; horizontal zone of propodeum longer than metanotum; frons and clypeus shining with punctures quite far apart; almost no sign of fronto-clypeal suture.

Colour dark brown with antennal flagellum anteriorly, labial segments 3 and 4, tibial bases and all tarsi yellowish.

**Male**
Length about 5.5 mm; wing length about 3.8 mm. Relative head measurements: width 7.7; length 8.5; clypeal length 2.4; lower interocular distance 4.5; upper interocular distance 5.0; interantennal distance 1.2; antennocular distance 1.1; interocellar distance 1.5; clypeo-antennal distance 0.7. Facial line distinct; upper margin of clypeus faint, almost straight; labial palps as in female; facial foveae indistinct; basitibial plate margins by incomplete carinae, about 1/4 length of hind tibia; inner hind tibial spur finely pectinate; horizontal zone of propodeum longer than metanotum; frons above antennae dullish, covered with close reticulation and scattered punctures; clypeus with median longitudinal furrow in basal half; foveae of second segment of gaster indistinct. Scattered long white hairs on clypeus, mandibles, scapes, posterior genae, vertex, dorsum of thorax, sides of thorax, legs, posterior margins of gastral sterna 3–5. Terminalia as in Figures 24, 25, 34, 43.

**Etymology**
The specific name refers to 'Meekatharra' the type locality.

---

**Euryglossa (Euhesma) pantoni** sp. nov.
Figures 9, 13, 15, 50

**Material Examined**

**Holotype**
♀, 18 km WSW Mulline, Western Australia,
432

29°51'S 120°20'E, 23 September 1982, B. Hanich and T.F. Houston, on *Eremophila pantonii* (WAM).

**Paratypes**

*Australia: Western Australia:* 6 ♀, 4 ♂, same data as holotype; 2 ♀, 5 ♂, Meleya Well 28°58'S 117°12'E, Thundelarra Station, 28 August - 2 September 1981, T.F. Houston, on *Eremophila pantonii* (WAM, UQIC, ANIC).

**Other Material**

*Australia: Western Australia:* 15 ♂, 50 km E of Leonora, 28°51'S 121°50'E, 10 September 1982, B. Hanich and T.F. Houston, on *Eremophila pantonii* (WAM); 1 ♂, Talling Station, September 1976, R.P. McMillan (WAM).

**Description**

**Female**

Length about 6.0 mm; wing length about 5.0 mm. Relative head measurements: width 7.2; length 9.0; length labial palp approximately 10.0; lower interocular distance 4.6; upper interocular distance 4.9; interantennal distance 1.4; antennocular distance 1.0; interocular distance 1.8; ocellocular distance 1.3; ocellocipital distance 0.7. Frontoclypeal suture indistinct, labial palp segments of increasing lengths in the order 1, 2, 4, 3, with 1 and 2 dark brown, 3 and 4 ribbon-like, whitish, segment 3 expanded basally (Figure 15), malar space evident; dorsum of head covered with fine reticulation, shining; supraclypeal area and clypeus medianly concave and brilliantly shining. Legs dark brown with distal end of femora, fore tibiae and all tarsi pale yellowish.

**Male**

Similar to female with more extensive long white hair on body. In specimens from Leonora, the gastral tergum 6 is wholly yellow (partially so in others).

**Remarks**

My theory that species of *Eremophila* are attended by bee species with mouthparts suitably modified is shaken by this species. It was taken at the same time as the species *E. leonora* which shows no marked lengthening of head or labial palps.

**Etymology**

The specific name refers to the species of *Eremophila* from which the bees were collected.

*Euryglossa (Euhesma) sulcata* sp. nov.

Figures 6, 17, 26, 27, 35, 44, 50

**Material Examined**

**Holotype**

♀, 85 miles (136 km) NNE of Meekatharra, Western Australia, 30 August 1971, T.F. Houston, on blue *Eremophila* (WAM).

**Paratypes**

*Australia: Western Australia:* 9 ♀, 2♂, same data as holotype (WAM, UQIC).

**Description**

**Female**

Length about 6.5 mm; wing length about 4.5 mm. Relative head measurements: width 8.0; length 9.5; clypeal length 2.3; lower interocular distance 5.2; upper interocular distance 5.4; clypeo-antennal distance 0.4; interantennal distance 1.9; antennocular distance 1.0; interocular distance 1.8; ocellocular distance 1.5; ocellocipital distance 1.0. Anterior margin of clypeus indented medianly, upper margin of clypeus indistinct, almost straight; clypeus with median longitudinal furrow; labial palps (Figures 6, 17) as long as head, segments of increasing length in the order 1 = 2, 3, 4, segments 1 and 2 dark brown, segments 3 and 4 expanded, ribbon-like, golden; horizontal zone of propodeum longer than metanotum; frons above antennae covered with close reticulation and sparse punctures, interspaces shining; clypeus and supraclypeal area shining. Legs dark brown with tarsi golden.

**Male**

Length about 5.5 mm; wing length about 4.2 mm. Relative head measurements: width 8.9; length 9.0; clypeal length 2.4; lower interocular distance 5.7; upper interocular distance 6.0; clypeo-antennal distance 0.4; interantennal distance 1.7; antennocular distance 1.4; interocular distance 2.0; ocellocular distance 1.6; ocellocipital distance 1.1. Anterior margin of clypeus slightly indented medianly, upper margin of clypeus indistinct, slightly concave; clypeus with median longitudinal furrow; labial palps as in female; facial foveae broad, shallow depressions, indistinct; basitibial plate margined by incomplete carinae and tubercles, about 1/3 length of hind tibia; inner hind tibial spur finely pectinate; horizontal zone of propodeum longer than metanotum; frons above antennae covered with close reticulation, punctures more numerous and closer together than in female; foveae of second tergum of gaster indistinct. Colour as in female with fore tibiae golden. Terminalia as in Figures 26, 27, 35, 44.

**Etymology**

The specific name is from Latin and refers to the furrow medianly on the clypeus.
Euryglossa (Euhesma) wiluna sp. nov.

Material Examined

Holotype
9, 26 miles (41.6 km) SSE of Wiluna, Western Australia, 1 September 1971, T.F. Houston, on blue Eremophila (WAM).

Paratypes
Australia: Western Australia: 39, same data as holotype (WAM, UQIC).

Description

Female
Length about 6.0 mm; wing length about 4.0 mm. Relative head measurements: width 7.5; length 9.5; clypeal length 2.4; lower interocellar distance 4.5; upper interocellar distance 5.2; clypeo-antennal distance 0.4; interantennal distance 1.5; antennocular distance 1.1; interocellar distance 1.9; ocellocular distance 1.4. Anterior margin of clypeus slightly indented, upper margin of clypeus concave; malar space very short; frons above antennae with close reticulation and sparse punctures; foveae of second tergum of gaster about 3/5 as wide as long; labial palp segments in increasing lengths 1 = 2, 3, 4 with segments 1 and 2 dark brown, segment 3 and basal 2/3 of 4 ribbon-like and yellowish; clypeus shining; supraclypeal area shining, concave. Legs mostly dark brown with tarsi golden.

Remarks
This species is very similar to E. yellowdinensis except in size. Until males are discovered, their relationship remains uncertain.

Etymology
The specific name refers to the type locality.

Euryglossa (Euhesma) yellowdinensis sp. nov.

Material Examined

Holotype
9, 31°18'5 S 119°44'E, 6 km E of Yellowdine, Western Australia, 10 October 1981, I.D. Naumann, J.C. Cardale, on flowers of Eremophila (ANIC).

Paratypes
Australia: Western Australia: 6 9, 17 9, same data as holotype (ANIC, WAM, UQIC); 1 9, same data as holotype on Melaleuca (ANIC).

Description

Female
Length about 5.0 mm; wing length about 4.00 mm. Relative head measurements: width 6.9; length 7.5; clypeal length 2.3; lower interocellar distance 3.8; upper interocellar distance 4.7; clypeo-antennal distance 0.3; interantennal distance 1.3; antennocular distance 0.9; interocellar distance 1.6; ocellocular distance 1.2; ocellocipital distance 0.4. Labial palps as long as head with segments of increasing lengths in the order 1, 2, 3, 4 with 1 and 2 dark brown and 3 and 4 ribbon-like, yellowish. Legs dark brown with fore tibiae anteriorly and all tarsi golden.

Male
Length about 4.0 mm; wing length about 3.0 mm. Relative head measurements: width 6.3; length 6.7; clypeal length 1.5; lower interocellar distance 3.4; upper interocellar distance 4.2; clypeo-antennal distance 0.6; interantennal distance 1.2; antennocular distance 0.7; interocellar distance 1.6; ocellocular distance 0.7. Colour as in female with more yellow on legs (mid tibiae anteriorly and bases of all tibiae).

Etymology
The specific name refers to the only locality known for this species.

Group 3

Euryglossa (Euhesma) coppinensis sp. nov.

Material Examined

Holotype
9, Coppin Pool area, 30 km S of Mt Bruce, NW Div., Western Australia, 10–13 May 1980, T.F. Houston et al., on flowers of Eremophila (WAM).

Paratypes
Australia: Western Australia: 9 9, same data as holotype (WAM, UQIC).

Description

Female
Length about 6.0 mm; wing length about 4.5 mm. Relative head measurements: width 9.0; length 9.0; clypeal length 2.8; lower interocellar distance 5.6; upper interocellar distance 5.9; clypeo-antennal distance 0.4; interantennal distance 2.0; antennocular distance 1.2; interocellar distance 1.8; ocellocular distance 1.6. Anterior margin of clypeus broadly truncate; upper margin of clypeus faint, slightly concave; labial palps exceedingly elongate,
Figures 49-51 49 Known distribution of *Euryglossa (Euhesma)* species. Group 1. longer than head, segments in increasing length in
the order 1, 4, 3, 2 with 2, 3 and 4 flattened, ribbon­like and apparently channelled medially; hori­zontal zone of propodeum longer than metanotum.

Labial palps with segment 1 dark brown, segments 2, 3, 4 yellowish with 2 infused with brown. Legs dark brown with tarsi yellowish.

Long white hairs on clypeus, frons, posterior genae, mesoscutum, scutellum, metanotum, sides of propodeum, sides of thorax, legs, venter.

Male
Length about 6.0 mm; wing length about 4.5 mm. Relative head measurements (Figure 19): width 9.0; length 8.0; clypeal length 2.0; lower interocular distance 6.0; upper interocular distance 6.0; clypeo-antennal distance 0.2; interantennal distance 2.0; antennocular distance 1.4; interocellar distance 1.9; ocellocellular distance 1.5. Anterior margin of clypeus gently convex; upper margin of clypeus not clear; facial foveae not evident; labial palps as in female; horizontal zone of propodeum longer than metanotum. Colour as in female, with labial palps with segment 1 dark brown, segment 2 brown, segments 3 and 4 yellowish. Terminalia as in Figures 30, 38 and 47.

Remarks
This is the only species in which the head of the female is not longer than wide. The head of the male is wider than long. The cup-like tip of the gonostylus of the genitalia (Figure 30) has not been seen elsewhere.

Etymology
The specific name refers to the type locality.

Euryglossa (Euhesma) macrayae sp. nov.
Figures 7, 8, 12, 16, 18, 28, 29, 36, 48, 51

Material Examined
Holotype
♀, 85 miles (136 km) NNE of Meekatharra, Western Australia, 30 July 1971, T.F. Houston, on blue Eremophila (WAM).

Paratypes
Australia: Western Australia: 10 ♀, 5 ♂, same data as holotype (WAM, UQIC, ANIC).

Other Material
Western Australia: 7♀, 8 km S of Lyons River Homestead, 24°38'S 115°20'E, 30 August 1980, on Eremophila platypala var. lancifolia (WAM 341-1); 2♀, same data, 16 km WSW of Lyons River Homestead, 30 August – 1 September 1980, on Eremophila cuneifolia Kraenzlin (WAM 344-11); 1♀, same data on pink Eremophila (WAM 344-13).

Description
Female
Length about 7.0 mm; wing length about 5.0 mm. Relative head measurements: width 9.5; length 10.4, clypeal length 3.3; lower interocular distance 6.0; upper interocular distance 6.0; antennal distance 2.2; antennocular distance 1.5; interocellar distance 2.0; ocellocellular distance 1.9; ocellocipital distance 0.8. Anterior margin of clypeus indented medianly, upper margin of clypeus slightly concave; labial palps (Figures 7, 16) exceedingly elongate, longer than head, segment 1 shortest, segments 2, 3, 4 about equal; facial foveae broad shallow depressions nearly 1/2 length of eyes; malar space short; horizontal zone of propodeum about as long as metanotum; clypeus shining; foveae of second segment of gaster about 1 1/2 times as long as wide.

Labial palps with segment 1 dark brown, segment 2 with basal half dark brown, distal half golden brown, segments 3 and 4 with basal half whitish, distal half golden brown; legs with coxae and trochanters black, all femora dark brown, tibiae and tarsi yellowish-brown.

Scattered long yellowish hairs on frons above antennae, vertex, clypeus, clypeal margin; shorter white hairs on dorsum of thorax, sides of propodeum; longer scattered white hairs on posterior genae, sides of thorax, legs, gastral sterna; long yellowish hairs on gastral terga 5 and 6.

Male
Length about 6.0 mm; wing length about 4.8 mm. Relative head measurements: width 7.3; length 7.3; clypeal length 2.1; lower interocular distance 4.6; upper interocular distance 5.1; clypeo-antennal distance 0.6; interantennal distance 1.4; antennocular distance 1.2; interocellar distance 1.4; ocellocellular distance 0.9. Anterior margin of clypeus indented medianly, upper margin of clypeus slightly concave; labial palps (Figure 18) as in female; facial foveae broad, shallow, indistinct; malar space short; inner hind tibial spur finely pectinate; horizontal zone of propodeum about as long as metanotum; foveae of second segment of gaster about 3 times as long as wide. Colour as in female except legs orange with coxae black. Scattered long white hairs on frons, clypeus, mandibles, vertex, posterior genae, dorsum of thorax; longer scattered white hairs on sides of thorax, legs, venter. Terminalia as in Figures 28, 29, 36, 48.

Remarks
Although the specimens from Lyons River
New Euryglossa (Euhesma) bees

area were taken from different species of Eremophila, I cannot separate them. None is as robust as the specimens from Meekatharra and when males are known a different species may be indicated.

Etymology
This species is named for my niece Elizabeth McCray whose typing skills greatly helped preparation of this manuscript.

Euryglossa (Euhesma) newmanensis sp. nov.

Material Examined

Holotype
♀, 14 miles (22.4 km) NE of Newman, Western Australia, 28 August 1971, T.F. Houston, on Eremophila (WAM).

Paratype
Australia: Western Australia: ♀, same data as holotype (WAM).

Description

Female
Length about 7.0 mm; wing length about 5.0 mm. Relative head measurements: width 8.9; length 10.1; clypeal length 2.9; lower interocular distance 5.9; upper interocular distance 6.1; interantennal distance 2.0; antennocular distance 1.2; interocellar distance 1.6. Labial palps as long as head with segment 1 shortest, segments 2, 3, 4 about equal in length.

Etymology
The specific name refers to the type locality.

Euryglossa (Euhesma) walkeri sp. nov.

Material Examined

Holotype
♀, 40 km N of Norseman, Western Australia, 31°52'S 121°24'E, 20 November 1989, K.L. Walker, on Eremophila (MV).

Australia: Western Australia: 2♀, same data as holotype, 5♀, 35 km E of Norseman, 32°12'S 122°04'E, 30 October 1989, K.L. Walker, on Eremophila; 1♀, 31 km S Norseman, 32°27'S 121°47'E, 31 October 1989, K.L. Walker, on Eremophila (MV, UQIC).

Other Material
Western Australia: 1♀, 31°07'S 121°24'E, 29 km SE by E of Coolgardie, 11 October 1981, (ANIC); 2♀, So[uthern] Cross, 19 November 1979, on Eucalyptus (RMBM); 1♀, 70–75 km ENE of Norseman, 10–16 November 1978, on flowers of Eremophila scoparia (WAM).

Description

Female
Length about 4.5 mm; wing length about 3.0 mm. Relative head measurements: width 6.3; length 7.0; clypeal length 1.8; lower interocular distance 3.4; upper interocular distance 4.1; interantennal distance 1.4; antennocular distance 0.5; interocellar distance 1.4; ocellocular distance 1.1. Upper margin of clypeus straight; labial palps longer than head, segments in increasing length in the order 1, 4, 3, 2 with 1 and 2 cylindrical and widest. Frons above antennae with obvious evenly-spaced punctures and very distinct frontal line; supraclypeal area and clypeus shining, concave, with fewer punctures.

Labial palps with segments 1 and 2 dark brown, 3 and 4 yellowish. Legs dark brown with tibiae and tarsi golden.

Long white hairs plentiful on ventral body surface and legs.

Etymology
The specific name honours Dr Ken Walker, the collector of this species with whom I’ve spent many hours collecting and discussing bees.

REFERENCES

Manuscript received 26 May 1997; accepted 6 October 1997.
CONTENTS VOLUME 18

Part 1

I. Bartsch
Halacarines (Acari: Halacaridae) from Rottnest Island, Western Australia: the genera Agauopsis Viets and Halacaropsis gen. nov. 1

S. McLoughlin
Early Cretaceous macrofloras of Western Australia 19

G.L. Pesce, P. De Laurentiis and W.F. Humphreys
Copepods from ground waters of Western Australia, I. The genera Metacyclops, Mesocyclops, Microcyclops and Apocyclops (Crustacea: Copepoda: Cyclopidae) 67

G.L. Pesce, P. De Laurentiis and W.F. Humphreys
Copepods from ground waters of Western Australia, II. The genus Halicyclops (Crustacea: Copepoda: Cyclopidae) 77

U. Scheller
A new species of Samarangopus (Myriapoda: Pauropoda) from Papua New Guinea 87

A.W.R. Bevan and P. Bindon
Australian Aborigines and meteorites 93

S.C. Choy
Caridina spelunca, a new species of freshwater shrimp (Crustacea: Decapoda: Atyidae) from a Western Australian cave 103

G.R. Allen
New records of reef and shore fishes from northwestern Australia 109

Part 2

D.J. Kitchener and A. Suyanto
A new species of Melomys (Rodentia: Muridae) from Riama Island, Tanimbar Group, Maluku Tenggara, Indonesia 113

M.R. Yardin and B.J. Richardson
Status of Anadara trapezia (Deshayes) (Bivalvia: Arcoida) from Oyster Harbour, Albany (Western Australia) as compared with east Australian populations 121

</table>
Guide to Authors

Subject Matter:
Reviews, observations and results of research into all branches of natural science and human studies will be considered for publication. However, emphasis is placed on studies pertaining to Western Australia. Longer papers will be considered for publication as a Supplement to the Records of the Western Australian Museum. Short communications should not normally exceed three typed pages and this category of paper is intended to accommodate observations, results or new records of significance, that otherwise might not get into the literature, or for which there is a particular urgency for publication. All material must be original and not have been published elsewhere.

Presentation:
Authors are advised to follow the layout and style in the most recent issue of the Records of the Western Australian Museum including headings, tables, illustrations and references.

The title should be concise, informative and contain key words necessary for retrieval by modern searching techniques. An abridged title (not exceeding 50 letter spaces) should be included for use as a running head.

An abstract must be given in full length papers but not short communications, summarizing the scope of the work and principal findings. It should normally not exceed 25% of the paper and should be suitable for reprinting in reference periodicals.

The International System of units should be used. Numbers should be spelled out from one to nine in descriptive text; figures used for 10 or more. For associated groups, figures should be used consistently, e.g. 5 to 10, not five to 10.

Spelling should follow the Concise Oxford Dictionary.

Systematic papers must conform with the International Codes of Botanical and Zoological Nomenclature and, as far as possible, with their recommendations.

Synonymy should be given in the short form (taxon, author, date, page) and the full reference cited at the end of the paper. All citations, including those associated with scientific names, must be included in the references.

Manuscripts:
The original and two copies of manuscripts and figures should be submitted to the Editors, c/- Publications Department, Western Australian Museum, Francis Street, Perth, Western Australia 6000. They must be in double-spaced typescript on A4 sheets. All margins should be at least 30 mm wide. Tables plus heading and legends to illustrations should be typed on separate pages. The desired position for insertion of tables and illustrations in the text should be indicated in pencil. Tables should be numbered consecutively, have headings which make them understandable without reference to the text, and be referred to in the text.

High quality illustrations are required to size (16.8 cm x 25.2 cm) or no larger than 32 cm x 40 cm with sans serif lettering suitable for reduction to size. Photographs must be good quality black and white prints, not exceeding 16.8 cm x 25.2 cm. Scale must be indicated on illustrations. All maps, line drawings, photographs and graphs, should be numbered in sequence and referred to as Figure/s in the text and captions. Each must have a brief, fully explanatory caption. On acceptance a computer disk containing all corrections should be sent with amended manuscript. The disk should be marked with program (e.g. Word, WordPerfect, etc).

In papers dealing with historical subjects references may be cited as footnotes. In all other papers references must be cited in the text by author and date and all must be listed alphabetically at the end of the paper. The names of journals are to be given in full.

Processing:
Papers and short communications are reviewed by at least two referees and acceptance or rejection is then decided by the editors.

The senior author is sent one set of page proofs which must be returned promptly.

The senior author will receive fifty free offprints of the paper. Additional offprints can be ordered at page proof stage.
