[Received 26 March 1976. Accepted 20 July 1976. Published 15 October 1976.]

ABSTRACT

Leucosia thysanotus sp. nov. from northwest Australia and Leucisca levigena sp. nov. from southwest Australia are described. L. thysanotus is distinguished from the closely related L. whitei Bell by the fringe of hair on the epibranchial angle and the weakly bilobed front. L. levigena is only the second species described for the genus which was erected by Macleay for the South African south coast species L. squalina.

INTRODUCTION

Since the publication on the Oxystomata and Gymnopleura of Western Australia by Tyndale-Biscoe and George (1962), further collecting, particularly in the shallower waters of the north coast, has been carried out. Two of the most important expeditions were the Crown of Thorns Starfish Survey in the Dampier Archipelago (1972-1974) and the *Dorothea* cruise (1962), which obtained collections between Port Hedland and Brisbane. This paper describes two new species of pebble crab resulting from these efforts. We wish to thank the members of the Commonwealth and Queensland Governments' Crown of Thorns Research Committee and Mr and Mrs W. Goode, owners of *Dorothea* whose support has advanced our knowledge of the State's marine fauna. Illustrations were prepared by Sue Clark.

Measurements of the crabs are midline carapace lengths from rostrum to posterior margin of carapace.

^{*} Department of Crustacea, Western Australian Museum, Francis Street, Perth.

Leucosia thysanotus sp. nov. (Figs 1 - 4)

Description

Carapace slightly longer than broad; front prominent, weakly bilobed; hepatic regions broadly raised with 40-60 microscopic granules; epibranchial angles pronounced, margined with a thick fringe of hair above base of arm; upper surface of lateral region with band of pubescence covering small marginal granules; thoracic sinus deep, extending posteriorly to level of last pair of walking legs, without anterior granules; thickened epimeral edge granulate, visible dorsally.

Dorsal inner and outer surfaces of arm of cheliped granular, interspersed with pubescence proximally; ventral surface smooth; dorsal proximal margin of arm with fringe of hair similar in texture and extent to that on epibranchial margin (Figure 3). Dorsal and ventral surfaces of wrist covered with small granules. Ventral margin of hand sharply granular; dorsal margin smooth or microscopically granular. Movable finger crested, with ridge on central inner surface; immovable finger with two feebly granular ridges on inner surface; fingers cross; cutting edge of fingers with hair.

Merus of 2nd to 4th walking legs almost square in section with microscopic granules along some angles. Carpus of 2nd and 3rd walking legs bicarinate; carpus of 5th unicarinate and of 4th uni- or bicarinate.

Abdominal formula of male 1+R+6+T; small projection on penultimate segment of abdomen. Abdominal formula of female 1+R+T.

Male pleopod (Figure 4). Short, stout, slightly curved with bulbous tip. Distal aperture at tip of tooth in centre of bulb surrounded by strong tuft of hair. Shaft bare, untwisted. Ridge straight on inner side of shaft.

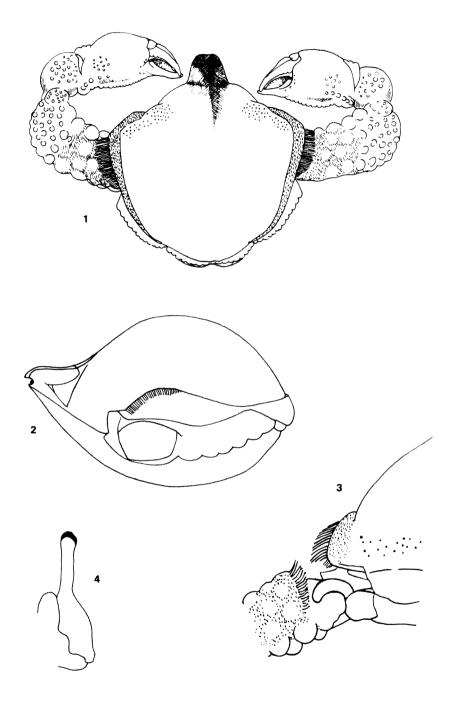

Colour

Carapace marbled with brown, white and orange; paler posteriorly. Front dark brown. Hepatic granules red. Arm of cheliped brown with white granules; hand pale with orange-brown spot on palm, base of fingers orange. Legs white with orange blotches.

Material examined

Holotype.— Adult male (14.1 mm), 22.v.74, dredged 3 m sand, some weed, Western Australian Museum Crown of Thorns Survey, WAM 79-75.

Type locality.—Norbill Bay, Rosemary I., Dampier Archipelago, northwest Australia.

Figures 1 - 4. Leucosia thysanotus sp. nov. 1. dorsal view; 2. lateral view; 3. cheliped joint viewed from front showing fringes on arm and on epibranchial angle; 4. 1st pleopod. Holotype male WAM 79-75.

Paratypes. -3 dd (13.1 - 13.8 mm) NE side of Rosemary I., Dampier Archipelago, northwest Australia, 4.xi.71, intertidal sand flats, B.R. Wilson *et al.*, WAM 80-75; 1 d (14.7 mm) 1.6 km S of Delambre I., Dampier Archipelago, 30.viii.61, dredged 11 m, B.R. Wilson and G.W. Kendrick, WAM 124-64; 4 dd (14.4 - 15.9 mm), 2 ?? (16.2 - 16.3 mm), 2 juveniles (13.8 - 14.7 mm), Broome, northwest Australia, 16.x.62, on exposed sand bar opposite town jetty, R.W. George on 'Dorothea', WAM 16-63.

Distribution

Northwest coast of Western Australia living in shallow protected sand flat conditions from Dampier Archipelago to Broome.

Comments

L. thysanotus is similar to L. whitei Bell in having the epibranchial angles pronounced, the presence of hepatic granules, the lateral band of pubescence and the projection on the male penultimate abdominal segment. It is easily distinguished however by the nature of the front, the hairiness of the epibranchial angle, the hepatic granules, the dorsal margin of the hand and the carpus of the walking legs; these differences are given in Table 1. The name thysanotus (Gr. = fringe) refers to the fringe of hair on the epibranchial angle.

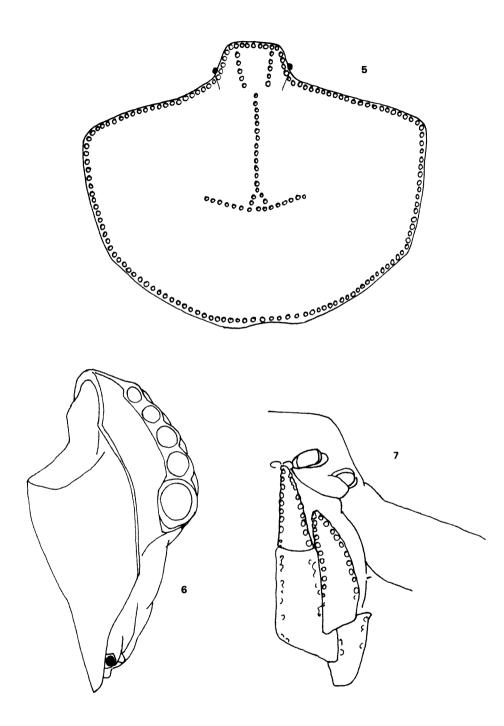

Leucisca levigena sp. nov. (Figs 5-7)

Description

Carapace subcircular with narrow truncate front marked by faint orbital sutures; submarginally depressed; margin faintly beaded; gastric region markedly elevated, outlined posteriorly by a transverse row of low tubercles; a beaded ridge extends forward from gastric elevation to about level of eyes; front concave, bearing two anteriorly diverging ridges.

Ventral surface of front and pterygostomian region smooth, punctate (Figure 7). Thorax smooth with some pits. External maxillipeds mostly smooth, exopod distinctly shorter than endopod and both margined with elevated granules.

Arm of cheliped short, squarish in section, 2/3 length of hand; ventral surface of wrist flattened; hand flattened with fingers twisted away from normal plane; tips of fingers sharply pointed and crossed; cutting edges smooth; surface of cheliped smooth and sparsely pitted.

Figures 5 - 7. Leucisca levigena sp. nov. 5. dorsal view; 6. lateral view; 7. pterygostomian region. Holotype female WAM 253-62.

Table 1. Comparison of Leucosia thysanotus sp. nov. and L. whitei Bell.

	L. thysanotus	L. whitei
Hair on epibranchial angle	Long thick fringe	Short, sparse
Front	Obscurely bilobed	Sharply tridentate
Hepatic region	40-60 microscopic red granules	10-14 obvious white granules
Dorsal margin of hand	Smooth or microscopically granular	Sharply granular
Carpus of 2nd and 3rd walking legs	Bicarinate	Unicarinate
Thoracic sinus anterior margin	Without granules	With granules

Table 2. Comparison of Leucisca levigena sp. nov. and L. squalina Macleay.

Front	Concave	Very slightly convex	Flat
Elevation of gastric region of carapace	Marked	Very slight	Slight
Pterygostomian region	Smooth	Pitted	Marked granules
Thoracic sternum	${ m Smooth}$	Pits and granules	Marked granules
Beading around margin of carapace	Faint	Marked	Marked

308

Colour

The preserved female holotype is uniform creamy-white.

Material examined

Holotype.— Adult female (4.9 mm), 1.i.61, 1 m on sheltered side of reef. G.W. Kendrick. WAM 253-62.

Type locality.— Yanchep Reef, Western Australia (31°33' S, 115°37' E).

Distribution

The species is represented by only one specimen from Yanchep on the southern west coast of Australia.

Comments

The present species falls clearly into the genus *Leucisca* Macleay, 1838 which is characterised by the smooth subcircular, depressed carapace with a raised beaded margin, the truncate front and the small deeply set eyes.

L. levigena sp. nov. is the second species recorded for the genus if Barnard's opinion (1950) that only one species occurs on the south coast of Africa is correct. He regards Carcinaspis marginatus Stimpson, 1858 and Leucisca phaenomma Stebbing, 1920 as synonyms of Leucisca squalina Macleay, 1838 and notes some geographical variation in size stating (1950, p.372) 'Natal specimens are smaller (both sexes) than Cape specimens, but otherwise indistinguishable'. However, an examination of specimens at the British Museum (Natural History) by one of us (R.W.G.) suggests that there are some morphological variations (Table 2) in L. squalina. This table sets out the distinguishing features of L. levigena as well. The name levigena (Lat. levis = smooth, gena = cheek) refers to the smooth pterygostomian region.

INSTRUCTIONS TO AUTHORS

Manuscripts

Manuscripts must be submitted in duplicate, typewritten, double spaced with wide margins. Positions of text figures and tables must be indicated. Authors may include an abstract for publication as part of a paper. The Committee may require an author to submit an abstract if no abstract is submitted and it considers that an abstract would be useful.

Illustrations

Papers may be illustrated by black and white line drawings or black and white photographs. One set of illustrations will be required. Photographs should be printed on white glossy paper, showing a full range of tones and good contrast. Top and bottom should be clearly indicated. Line drawings should be no more than three times the maximum size for publication, which is 19 cm x 12.5 cm, including caption. Authors should be done lightly in blue pencil. Composite illustrations are to be submitted separately, with a sketch of authors' requirements. Final illustrations will be produced by the Western Australian Museum's display artists.

Footnotes

Footnotes should be avoided whenever possible. Essential footnotes, indicated by superscript figures in the text, should be inserted immediately below the reference and should be separated from it by a line drawn across the top and bottom of the footnote and extending the width of the page.

Style

Authors are advised to follow the Australian Government Printing Office Style Manual. The *Records* Committee may approve departures from the Style Manual if a case is made that some particular form is inappropriate in a particular work.

References

Authors' names and dates of publication given in text; full references at end of paper in alphabetical order of authors' names. References at end of paper must be given in this order: Name of author, in capitals, followed by initials; names of joint authors connected by "&", not "and". Year of publication in parentheses; several papers by the same author in one year designated by suffixes a, b, etc. Full title of paper; initial capital letters only for first word and for proper names (except in German). Title of journal, if abbreviated, to be according to *World list of scientific periodicals* and underlined (italics). Series number, if any, in parentheses, e.g. (3), (n.s.), (B). Volume number in arabic numerals (without prefix "vol"), with wavy underlining (bold type). Part number, only if separate parts of one volume are independently numbered. In such cases part number is given, in parentheses, after the volume number. Page numbers, first and last, preceded by a colon (without prefix "p"). Thus:

SMITH, A.B. (1956)-New Plonia species from Western Australia. Ann. Mag. nat. Hist. (12) 9: 937-945.

A reference to a book not forming part of a series should contain the following information in this order: name of author in capitals, followed by initials; year of publication in parentheses; title, underlined; edition, if any; volume number, if any, in arabic numerals, with wavy underlining; place of publication, name of publisher. Thus:

BROWN, X.Y. ed. (1953)-Marine faunas. 2nd ed. 2. London: Green.

When reference is made of a work forming a distinct part (such as a chapter or an appendix of a book by another author, or editor, give: name of author of paper, his initials; date of publication; title of paper; "In", underlined; name of author (or editor) of book; his initials; title of book, underlined; edition, if any; volume number, if any; in arabic numerals, with wavy underlining; pagination of paper; place of publication; name of publisher. Thus:

SMITH, C.D. (1954)-Western Australian plonias. In Brown, X.Y. Marine faunas. 2nd ed. 3: 63-95. London: Green.

Free copies to Authors

Thirty free off-prints of each paper published in the *Records* shall be provided to each author.
