

Part 2

Hermatypic corals of Ashmore Reef and Cartier Island

J.E.N. Vernon*

Abstract

Ashmore Reef has the highest species diversity of any area off the coast of Western Australia. Two-hundred and fifty-five species of 56 genera are recorded. Five species, *Pavona* sp., *Psammocora* sp., *Porites eridani*, *Platygyra ryukyuensis* and *Mycedium robokaki* were found in Australia for the first time. Many other species known from eastern Australia are new records for Western Australia.

Background and discussion

Since no previous coral collections had been made from Ashmore Reef, as many habitats as possible were sampled in the time available. Most collections were made by SCUBA diving supplemented by snorkelling and reef walking; the collecting effort was similar to that at Scott Reef and the Rowley Shoals so that fairly valid comparisons of the coral faunas can be made.

Ashmore Reef with 255 species of 56 genera has a considerably richer coral fauna than Scott and Seringapatam Reefs (219 species of 56 genera) or the Rowley Shoals (188 species of 52 genera) (Veron 1986). Altogether 236 species have been recorded from these atolls (Veron 1986a, Veron and Marsh 1988), considerably fewer than the number of species recorded from Ashmore and Cartier Reefs. Five species, *Psammocora* sp., *Porites eridani*, *Platygyra ryukyuensis* and *Mycedium robokaki* are known from various localities to the north of Australia but were found in Australia for the first time at Ashmore Reef.

Many other species known from eastern Australia were found for the first time in north-western Australia at Ashmore Reef (Veron and Marsh 1988).

Records are from Veron and Marsh (1988) with some nomenclatural changes after Hoeksema (1989).
